

Online School Performance Analytics

Case Summary Report

End-to-end business analytics project for an online school: data audit, cleaning, EDA, marketing and sales analysis, product analytics, unit economics, growth hypothesis and interactive dashboard.

Total Deals	Paid Deals	Payment Conversion	Actual Revenue	Marketing Spend	ROMI
21,593	858	3.97%	978,651	149,223.45	2,156.74%

Project Scope

- Analyzed CRM, sales calls and marketing spend data in one reproducible analytics workflow.
- Prepared documentation, data audit, cleaning rules, cleaned datasets, business analysis, unit economics and dashboard outputs.
- Built a Plotly Dash dashboard covering funnel, acquisition, sales, products and growth economics.

1. Analytical Workflow and Business Rules

Data Dictionary	Data Audit	Cleaning Rules	Data Cleaning	EDA & Business Analysis	Unit Economics	Dashboard
-----------------	------------	----------------	---------------	-------------------------	----------------	-----------

- Paid deal definition: Stage = Payment Done.
- Actual revenue is based on Initial Amount Paid only for paid deals; Offer Total Amount is treated as potential contract value.
- Source is used as the main level for marketing analysis; Campaign, Term, Content, AdGroup and Ad are supporting details.
- CRM-style IDs are cleaned and processed as strings to preserve table relationships.
- Rows with data quality flags are kept in the dataset and excluded only from calculations where the issue is critical.

2. Overall Business Performance

Large deal flow with low payment conversion.

- 21,593 deals were recorded; 858 became paid deals, resulting in 3.97% payment conversion.
- The main growth challenge is conversion from created deals to paid students, not initial deal volume.

Online School Performance Dashboard

Interactive dashboard for analyzing online school sales, marketing, products and unit economics.

Overview	Marketing	Sales	Products	Unit Economics
----------	-----------	-------	----------	----------------

Online School Overview

This tab shows the overall business picture: funnel, paid deals, revenue, conversion and monthly dynamics.

3. Marketing Performance

Acquisition channels differ by volume, conversion and revenue.

- Facebook Ads, Google Ads, Organic and SMM are the key business-driving sources.
- Source is the most reliable level for marketing conclusions; campaign analysis is used as supporting detail.

Online School Performance Dashboard

Interactive dashboard for analyzing online school sales, marketing, products and unit economics.

Overview	Marketing	Sales	Products	Unit Economics
----------	-----------	-------	----------	----------------

Marketing

This tab shows acquisition channel performance: spend, revenue, conversion, cost per lead, customer acquisition cost and lead quality.

4. Sales Team Performance

Manager performance should be assessed through several metrics together.

- Workload, conversion, paid deals, revenue, average check and call activity vary materially across managers.
- High workload does not automatically equal high conversion or stronger revenue contribution.

Online School Performance Dashboard

Interactive dashboard for analyzing online school sales, marketing, products and unit economics.

Overview	Marketing	Sales	Products	Unit Economics
----------	-----------	-------	----------	----------------

Sales

This tab shows sales team performance: workload, conversion, revenue, average check, call activity, SLA and the link between sales and acquisition sources.

5. Product Revenue Structure

The product portfolio is concentrated around several main products.

- Digital Marketing is the leading product by paid deals and revenue.
- UX/UI Design and Web Developer also contribute, while small categories are excluded from main product charts.

Online School Performance Dashboard

Interactive dashboard for analyzing online school sales, marketing, products and unit economics.

Overview	Marketing	Sales	Products	Unit Economics
----------	-----------	-------	----------	----------------

Products

This tab shows the product sales structure: paid deals, revenue, average check, payment types and distribution by education type.

6. Unit Economics

Aggregate unit economics is positive and supports further optimization.

- Contribution margin equals 3,224,833.67 and ROMI equals 2,156.74%.
- C1 conversion was selected as the most actionable metric for a short growth experiment.

7. Growth Hypothesis and Recommended Next Step

A practical HADI hypothesis can be tested within two weeks.

- Hypothesis: an updated first-contact and follow-up script can increase lead-to-client conversion C1 by at least 10%.
- Experiment parameters: 560 leads, average flow of 51 leads per day, estimated duration of 11 days.
- The experiment can be run within 14 days and provides a manageable next step for performance improvement.

Online School Performance Dashboard

Interactive dashboard for analyzing online school sales, marketing, products and unit economics.

Overview	Marketing	Sales	Products	Unit Economics
----------	-----------	-------	----------	----------------

Unit Economics

This tab shows overall project unit economics, product-level unit economics, the main growth point and HADI hypothesis parameters.

- Overall Metrics
- Growth Point
- Details

Product Unit Economics Limitation

Unit economics charts include only products with clients in the calculation base: Digital Marketing, UX/UI Design and Web Developer. Data Analytics and Find yourself in IT are not included in the scenario analysis because they have no clients matching the calculation conditions.

HADI Hypothesis

Hypothesis

If an updated first-contact and follow-up script is implemented for new leads, then lead-to-client conversion C1 will increase by at least 10%.

Experiment Parameters

Metric: C1
Expected uplift: +10%
Sample size: 560 leads
Average flow: 51 leads per day
Experiment duration: 11 days

The scenario analysis above shows the effect of a C1 +5% change. The HADI hypothesis tests a more pronounced experimental effect of C1 +10%.

The experiment can be run within 14 days
